Preface	ix
1 Introduction	1
2 Basic notions of homological algebra	11
2.1 Graded vector spaces, chain complexes, and differentials . . .	11
2.2 Cycles, boundaries, and homology	12
2.3 Example: The simplicial chain complex	12
2.4 Chain maps	15
2.5 Cochain complexes	16
2.6 Example: The de Rham complex	16
3 Basic notions of unbounded operators on Hilbert spaces	21
3.1 Unbounded operators	21
3.2 Closed operators	22
3.3 The adjoint of an unbounded operator	23
3.4 Example: grad, curl, and div and their adjoints	27
4 Hilbert complexes	33
4.1 Hilbert complexes and their duals	33
4.2 Harmonic forms, the Hodge decomposition, and the Poincaré inequality	35
4.3 Example: The L^2 de Rham complex	37
4.4 The abstract Hodge Laplacian	39
4.5 Example: The Hodge Laplacian in \mathbb{R}^3	44
5 Approximation of Hilbert complexes	51
5.1 Galerkin discretization of the primal formulation	51
5.2 Mixed methods of discretization	54
6 Basic notions of exterior calculus	63
6.1 Exterior algebra	63
6.2 Exterior calculus	68
7 Finite element differential forms	81
7.1 The complete polynomial spaces of differential forms	82
7.2 The Koszul complex	83
7.3 The trimmed polynomial spaces of differential forms	85
7.4 Finite element differential forms	86

7.5	Properties of the finite element spaces	88
7.6	The Whitney forms $\mathcal{P}_1^-\Lambda^k$ and de Rham's theorem	90
7.7	Cubical elements	91
7.8	Historical antecedents	93
8	Further directions and applications	97
8.1	Eigenvalue problems	97
8.2	Variable coefficients	98
8.3	Lower order terms	99
8.4	Differential equations on manifolds	101
8.5	Parabolic and hyperbolic problems	101
8.6	Maxwell's equations	103
8.7	The Stokes equations	104
8.8	Elasticity	107
	Bibliography	113
	Index	119
