List of Figures	xi	List of Tables	xv
Preface			xv
1 Modeling			1
1.1 An Example with Yes/No Choices			1
1.1.1 Choosing Variables			2
1.1.2 Modeling Constraints			2
1.1.3 The Objective Function and the Final Model			3
1.1.4 Solving the Model			3
1.2 Four Rules of Thumb for Modeling			4
1.3 A Blending Example			5
1.3.1 Choosing Variables			6
1.3.2 Modeling Constraints			6
1.3.3 The Objective Function and the Final Model			7
1.3.4 Solving the Model			7
1.4 A Scheduling Example			8
1.4.1 Choosing Variables			8
1.4.2 Modeling Constraints			9
1.4.3 The Objective Function and the Final Model			9
1.4.4 Solving the Model			10
1.5 An Assignment Example			10
1.5.1 Choosing Variables			10
1.5.2 Modeling Constraints			11
1.5.3 The Objective Function and the Final Model			11
1.5.4 Solving the Model			12
1.6 A Partitioning Example			12
1.6.1 Choosing Variables			12
1.6.2 Modeling Constraints			13
1.6.3 The Objective Function and the Final Model			14
1.6.4 Solving the Model			15
1.7 Modeling Problems			16

2	Impractical Optimization	25
2.1	Algebra Limitations	26
2.2	Size Limitations	29
2.2.1	Integral Optimization	29
2.2.2	Discretization	30
2.3	Conclusions from Chapter 2	33
3	Basic Practical Optimization	35
3.1	Replacement Functions	36
3.1.1	When to Stop	42
3.1.2	Why It's Called Newton's Optimization Method	43
3.2	From Stationary Points to Optimizers	44
3.2.1	But I Learned a Different Second-Derivative Test in Multivariable Calculus	47
3.2.2	Details for Functions of More Than Two Variables	48
3.2.3	More on Stopping	49
3.3	Conclusions from Chapter 3	53
4	Some Practical Modifications	55
4.1	Finding Optimizers	55
4.2	Improving Success	59
4.3	Reducing Expense	61
4.4	Conclusions from Chapter 4	61
5	How Methods Are Ranked	63
5.1	Ranking Newton's Optimization Method	66
5.2	Ranking the Quasi-Newton Methods	67
5.3	Conclusions from Chapter 5	71
6	Constraints	73
6.1	Penalty Methods	75
6.1.1	A Simple Differentiable Penalty Function	75
6.1.2	Improved Penalty Functions	76
6.1.3	Barrier Functions	80
6.1.4	Impassable Barriers?	82
6.2	The Reduction Method	84
6.2.1	Converting Inequalities to Equations	84
6.2.2	Reducing Variables	86
6.3	Conclusions from Chapter 6	88
7	More Practical Modifications	89
7.1	Reduction Modifications	89
7.1.1	The Working-Set Method: Hitting the Boundary	89
7.1.2	Lagrange Multipliers	93
7.1.3	Multipliers for Inequalities	95
7.1.4	Multipliers for Each Constraint	96
7.1.5	Putting This All Together	100

Contents

ix

7.2	Special Case: Linear Programming	101
7.2.1	Dual Linear Programs	102
7.2.2	Dual Variables as Multipliers	105
7.2.3	Stopping for Linear Programs	106
7.3	Sequential Quadratic Programming	107
7.3.1	The Lagrangian Function	107
7.3.2	Prelude to the SQP Method	108
7.3.3	The SQP Method	111
7.4	Conclusions from Chapter 7	113
8	Integer Variables	115
8.1	Simple Rounding	116
8.1.1	Trouble with Simple Rounding	117
8.2	The Branching Method	118
8.2.1	Practical Modifications to Branching	121
8.3	The Cutting Method	122
8.4	Automatic Integers: Network Problems	124
8.5	Conclusions from Chapter 8	127
9	Other Methods	129
9.1	Dynamic Programming	129
9.1.1	Multistage Decision Processes	129
9.1.2	The Dynamic Programming Method	130
9.1.3	Comparison and Current Work	132
9.2	What Else?	136
9.2.1	Direct Search Methods	136
9.2.2	Stochastic Search Methods	136
9.2.3	Linear Methods	137
9.2.4	Primal-Dual Methods	137
9.2.5	Nonlinear Methods	137
9.3	A Research Project	138
9.3.1	Annotated Bibliography	138
9.3.2	Problem Setting	138
9.3.3	Method Description	138
9.3.4	Comparison and Current Work	138
	Appendix of Asides	139
	Bibliography	145
	Index	147
