O TUTORIAL

Tutorial on Parallel Computing with Applications to Linear Algebra April 18, 1993

Organizers: Todd Arbogast and Clint N. Dawson Department of Mathematical Sciences, Rice University

Tutorial Description and Objectives

The use of parallel computers to solve large-scale problems arising in the geosciences is an area of growing interest. In the last several years, many new algorithms have been developed and current algorithms have been adapted for use on parallel machines. This tutorial will cover the basic aspects of parallel computing including architectures and performance issues, and then concentrate on parallel computation in the solution of linear algebraic systems and eigenvalue problems, and in the numerical solution of partial differential equations.

Among the topics to be discussed: Block algorithms-BLAS, LAPACK, algorithms and software for large sparse linear systems and eigenvalue problems, domain decomposition for numerical solution of partial differential equations, discussion of available domain decomposition software, and how to use networks of workstations as parallel computers.

Who Should Attend?

Academic, industrial, and government researchers who are interested in the use of parallel computers to solve geoscience problems.

Recommended Background

A basic knowledge of computational linear algebra (Gaussian elimination, eigenvalues and eigenvectors, iterative methods), as well as some knowledge of partial differential equations.

Lecturers

William Gropp received his Ph.D. in computer science from Stanford University in 1982. He was an assistant and associate professor of computer science at Yale University from 1982 until 1990; he is currently a computer scientist at the Argonne National Laboratory. Dr. Gropp has been working on parallel methods for PDEs since 1984, when he used a cluster of Apollo workstations. His most recent work is on parallel domain decomposition methods for both high-end parallel computers (such as the Intel Touchstone Delta) and for clusters of workstations.

David Keyes is an associate professor in the Department of Mechanical Engineering at Yale University, a regular visitor at ICASE and Argonne National Laboratory, and a consultant at UTRCC and Boeing. His principal research interests are in parallel computational fluid mechanics and combustion. He received his Ph.D. in applied mathematics from Harvard University in 1984.

Danny Sorensen received his B.S. in mathematics from University of California, Davis in 1972 and his Ph.D. in mathematics from University of California, San Diego in 1977. He was an assistant professor of mathematics at University of Kentucky from 1977-1980. He then joined the mathematics and computer science division of Argonne National Laboratory where he became a senior computer scientist. He joined the faculty of Rice University in 1989. Dr. Sorensen was one of the founders of the Advanced Computing Research Facility at Argonne National Laboratory. This facility was one of the first to provide public access to a variety of parallel computers. His research interests are in computational mathematics with emphasis on numerical linear algebra and parallel computing. He has also worked extensively in the area of nonlinear numerical optimization. His current research activities involve parallel iterative techniques for the solution of large scale algebraic eigenvalue problems.

PROGRAM OVERVIEW

Following are subject classifications for the sessions. The codes in parentheses designate session type and number. The session types are invited presentations (IP), contributed presentations (CP) and minisymposium (MS).

Atmospheric Modeling

Atmospheric Modeling (CP8, page 12) Climate Stability and Nonlinear Dynamics (IP6, page 11) Dynamics of Urban and Regional Air Pollution (IP3, page 6) Poster Session (page 10)

© Environmental Models

Biodegradation, Dissolution and Other Forms of Reactive Flow and Transport (MS25, page 11)

Dispersal of Pollutants in the Environment (MS3, page 5)

Modeling Fluid Flow and Contaminant Transport in Heterogeneous Porous Media (MS4, page 5)

Poster Session (page 10) Simulation of NAPL Groundwater Contamination (MS19, page 10) Simulation of Porous Media Flows and Contaminant Transport in Geological Waste Repositories, Parts I and II (MS14, page 8; MS21, page 10)

Geochemical Models

Multi-Scale Unstable Geochemical Dynamics: Homogenization and Bifurcation Approaches to Problems in Petroleum Exploration and Production (IP2, page 5) Nonlinear Phenomena in Geochemical Systems: Homogenization, Bifurcation, and Numerical Approaches, Parts I and II (MS5, page 6; MS10, page 7)

Heterogeneities and Parameter Estimation

A Review of Current Trends in Petroleum Reservoir Simulation and Assessment of the Impacts on Oil Recovery (IP7, page 11) Dispersal of Pollutants in the Environment (MS3, page 5)

Homogenization for Flow and Transport through Porous Media (MS15, page 9) Macrodispersion for Flow in Porous Media (IP8, page 12)

Optimization and Parameter Estimation (MS7, page 6)

Parameter Identification I and II (CP1, page 6; CP12, page 13) Poster Session (page 10)

Predicting Versus Interpreting: A Survey of Oil Recovery Modeling (IP5, page 8)

Reservoir Characterization (MS23, page 11) Transport in Media Which Possess Evolving Heterogeneity (MS27, page 12)

Hydrology

Computational Advances in Modeling of Surface Water Flow (MS8, page 7) The Role of Computational Science in Groundwater Hydrology (IP1, page 5)

Numerical Methods

Adaptive Methods (CP11, page 13) Efficient and Accurate Determination of Fluid Velocities (MS16, page 9) Numerical Algorithms for Modeling Transport Phenomena in Porous Media, Part 2 of 2 (MS26, page 12) Numerical Techniques for Computation of Ground Water Flows (MS9, page 7)

Parallel Domain Decomposition and Multigrid Techniques (MS1, page 5) Predicting Versus Interpreting: A Survey of Oil

Recovery Modeling (IP5, page 8) Porous Media Modeling I (CP5, page 9)

Oceanography

High Resolution Ocean Modeling (MS13, page 8) Oceanography (CP10, page 13) Poster Session (page 10) The Impact of Ocean Waves on Coastal Regions (MS18, page 10)

Optimization

Global Optimization Methods in Geosciences (MS2, page 5) Modeling and Management (CP2, page 6) Optimization and Parameter Estimation Problems in Porous Media (MS7, page 6)

Parallel Computing

Efficient and Accurate Determination of Fluid Velocities Parallel Algorithms (CP9, page 12)

Parallel Computation in Applications (MS6, page 6)

Parallel Domain Decomposition and Multigrid Techniques (MS1, page 5)

Vectorization and Parallelization in Reservoir Simulation (MS11, page 8)

Seismic Inversion

Recent Progress in Seismic Imaging for Reservoir Analysis (IP4, page 8) Seismic and Inverse Imaging (CP4, page 7) Seismic Imaging and Inversion: Resolution. Geological Constraints, and Algorithms, Parts 1 and 2 (MS12, page 8; MS17, page 10) Wavelet-Based Methods in the Geosciences (MS29, page 13)

Transport in Porous Media

Hyperbolic Systems in Porous Media Flow (MS20, page 10)

Numerical Algorithms for Modeling Transport Phenomena in Porous Media Parts 1 and 2 (MS22, page 11; MS26, page 12)

Numerical Techniques for Computation of Ground Water Flows (MS9, page 7) Porous Media Modeling I and II

(CP3, page 7; CP6, page 9) Some Aspects of Porous Media Research in the Netherlands (MS24, page 11)

Reservoir Simulation Research at INTEVEP, S.A. (MS28, page 12)

Transport in Porous Media (CP7, page 10) Transport in Media Which Possess Evolving Heterogeneity (MS27, page 12)

THREE VOLUMES IN GEOPHYSICAL FLUID AND SOLID MECHANICS

Edited by

W.E. Fitzgibbon and M.F. Wheeler

These three volumes have been developed as an outgrowth of interest in the talks given at the SIAM Conference on Mathematical and Computational Issues in Geophysical Fluid and Solid Mechanics held in Houston, Texas in September 1989.

The editors have organized these reference volumes to reflect the interests of the mathematicians, geoscientists, hydrologists, engineers, and computational scientists who participated in the meeting. Applications include, but are not limited to, flow in porous reservoir and aquifers, basin modeling, seismic modeling and inversion, containment transport, and remote sensing.

Although each volume has been designed to be self-contained, the three-volume set gives a thorough representation of research currently taking place in the geoscience field.

A set price of \$99.50 (list) and \$79.60 (SIAM members) is currently available for the purchase of the complete library.

Computational Methods in Geosciences

"Discusses a dozen topics related to mathematical and computational issues in geophysical fluid and solid mechanics. including local grid refinement for reservoir simulation, a method of factoring long z-transform polynomials, and the finite element modelling of surface flow problems.... -Sci-Tech Book News, November, 1992.

1992 / vii + 207 pages / Soft / ISBN 0-89871-301-3 List \$44.50 / SIAM Member \$35.60 / Code OT33

Modeling and Analysis of Diffusive and Advective **Processes in Geosciences**

"Not a collection of proceedings, but 11 papers on topics that emerged from a September 1989 conference in Houston on mathematical and computational issues in geophysical fluid and solid mechanics. The discussions include a semi-linear heat equation subject to the specification of energy, an analytic solution to a pumped leaky aquifier system, and the simulation of elastic sedimentary processes...." -Sci-Tech Book News, November, 1992.

The Role of Computational Science
in Groundwater Hydrology

In groundwater hydrology, numerical models are often used to analyze contaminant transport problems at specific field sites. However, with the continuing development of very powerful computer hardware, numerical simulation is now being viewed in a more scientific role: simulations can be performed in lieu of certain physical experiments. This makes it possible to study a wide range of problems, for example the influence of material heterogeneities on transport parameters. This type of computational science requires highly accurate and efficient numerical algorithms but also requires the analyst to understand physical aspects of the problem such as scales of motion and measurement techniques. Example calculations involving multi-phase flow and transport demonstrate how computational science can be used to determine effective large-scale parameters, which cannot be measured physically, based on quantities that can be measured at smaller scales.

Multi-Scale Unstable Geochemical

Dynamics: Homogenization and

Bifurcation Approaches to Problems
in Petroleum Exploration and

Production

The evolution of a sedimentary basin (100 km-scale in width and 10 km-scale in depth) involves the interplay of many strongly coupled reaction, transport and mechanical processes. These processes operate on length scales from the submeter to basin wide. They involve symmetry-breaking instabilities that lead to petroleum-trapping banded rock, kilometer-scale hydrologic compartments and submeter-scale crystal growth patterns. Homogenization theory allows us to model the multiple-scale, unstable dynamical system. As a result states of the basin can be predicted that are self-organized in space and are oscillatory in time. The speaker will present illustrative examples of application of bifurcation theory and homogenization theory and of related computational algorithms. He will consider applications to problems in petroleum exploration and production.

Parallel Domain Decomposition and Multigrid Techniques

This session will focus on the parallel solution of partial differential equations that arise in geoscientific applications. These problems tend to be very large and highly ill conditioned, so the goal is to find ways to solve them effectively on large, massively parallel machines. The convergence properties of the solution algorithm must scale well to many processors; otherwise, the cost of communications overwhelms the computing power of the machine and additional processors do not reduce the run-time. Two current techniques for solving these problems in parallel include domain decomposition and multigrid. The formulation and implemention of these techniques in a parallel environment will be explored.

Organizers: Todd Arbogast and Clint N. Dawson Rice University

10:30 Domain Decomposition Methods for the Solution of PDE's William D. Gropp, Argonne National Laboratory

11:00 Noniterative Domain Decomposition for Second-Order Hyperbolic and Parabolic Problems Todd F. Dupont, University of Chicago

12:00 Parallel Multigrid Methods for Petroleum Reservoir Problems Joel E. Dendy, Los Alamos National Laboratory

MS2/Arboretum 1

Global Optimization Methods in Geosciences

Many problems in geosciences have been successfully solved by using global optimization methods in general and Simulated Annealing Method (SAM) in particular. Innovative and successful approaches, in various applications, confirm the great potential of global optimization methods, especially in geosciences where the number of parameters to estimate is huge compared to conventional applications in science nd engineering.

In this minisymposium, the speakers will provide a global picture and the state-of-the-art in global optimization applied to geosciences, and discuss further applications and enhancements such as parallelization of the optimization methods for reducing the computational time.

Organizers: Allan Gutjahr and Ahmed Ouenes New Mexico Institute of Mining and Technology

Dispersal of Pollutants in the
Environment

The challenge of developing mathematical models to provide predictive capability for the spreading and dilution of contaminants released in the complicated flows of the environment is formidable. In this session, the speakers will discuss the underlying theoretical difficulties and review the current generation of mathematical models. Because of the theoretical difficulties associated with the prediction of the concentration field of an environmental contaminant, it is crucial that detailed experimental validation be obtained for any proposed mathematical model. Aspects of such validation processes, along with some field data, will be discussed.

Organizers: William G. Pritchard, Penn State University, University Park, and Paul J. Sullivan, The University of Western Ontario, Canada

10:30 The Dilution of a Contaminant Spill in Environmental Flows
Paul J. Sullivan, Organizer

11:00 Fractal Interpretation of Particulate Dispersion K.R. Sreenivasan, Yale University

12:00 The Next Generation of Quantitative Models of Environmental Pollution Philip Chatwin, University of Sheffield, United Kingdom

MS4/Arboretum 3

Modeling Fluid Flow and Contaminant Transport in Heterogeneous Porous Media

The speakers in this minisymposium will present methods currently being used to incorporate material heterogeneities into mathematical and numerical models of contaminant transport in the subsurface. They will discuss analytical and numerical approaches. The analytical techniques range from stochastic methods to spatial filtering, while the numerical methods range from pore-scale models of multiphase flow to large-scale continuum models of contaminant transport. The speakers will stress the importance of measurements and the systematic incorporation of data into the different models. Although this minisymposium focuses on groundwater contamination, the techniques presented are applicable to a wide range of porous media flow problems.

Organizer: Michael A. Celia Princeton University

10:30 Field-Scale Transport Processes in Heterogeneous Aquifers Lynn W. Gelhar, Massachusetts Institute of Technology

11:00 Monte Carlo Analysis of Nonreactive and Reactive Solute Transport in Three-Dimensional Heterogeneous Porous Media: Mean Displacement, Plume Spreading and Uncertainty Edward A. Sudicky, University of Waterloo, Canada

11:30 Modeling the Large-Scale Dynamics of Fluid Flow in Heterogeneous Porous Media Using Spatial Filtering Theory Roger Beckie, University of British Columbia, Canada, and Alvaro Aldama, Mexican Institute of Water Technology, Mexico

12:00 Pore-Scale Modeling of Multiphase Flow and Transport in Heterogeneous Porous Media

Harihar Rajaram, Lin A. Ferrand, Princeton University, and Michael A. Celia, Organizer

MS5/Arboretum 4

Nonlinear Phenomena in Geochemical Systems: Homogenization, Bifurcation, and Numerical Approaches (Part 1 of 2)

Reaction, transport and mechanical processes in geological systems may be strongly coupled and, as the underlying partial differential equations are nonlinear, lead to symmetry-breaking instabilities, temporal oscillation, propagating fronts and a host of other nonlinear phenomena. Such phenomena arise on both the geological and engineering time scales and play a central role in petroleum and mineral exploration and production and in environmental problems. The challenge is to delineate phenomena that can occur and predict the conditions favoring them. Their spatial complexity makes these systems ready but difficult problems for homogenization and numerical analysis.

Organizer: Peter J. Ortoleva Indiana University, Bloomington

10:30 Geochemical Reaction-Transport Modeling on a Shared Memory, Multi-Processor System

Wei Chen, Silicon Graphics Computer Systems, Hudson, MA; Yueting Chen, Jun Mu, Indiana University Bloomington; and Peter J. Ortoleva, Organizer

Dynamics of Urban and Regional Air Pollution

Urban and regional air pollution is one of the world's most pervasive environmental problems. Mathematical models of atmospheric physics and chemistry relate source emissions to ambient pollutant concentrations in urban and regional areas occurring over episodes of several days duration. These models are based on solution of the species conservation equations over a three-dimensional atmospheric grid. Computational constraints have limited the extent of fundamental chemistry and physics that can be included in such models; for example, small particles (aerosols) and cloud and fog phases have not generally been incorporated in spite of their importance. Parallel computation offers promise to break the computational barrier to air pollution modeling. The speaker will present an overiew of the current status of urban and regional air pollution modeling.

Parallel Computation in Applications

In this session, various aspects of parallel, high-performance, geoscientific computing will be explored. The large and complex problems that arise in geoscientific applications are often solved on supercomputers. Massively parallel, distributed memory computers currently require that the programmer consider special programming problems, such as the solution of large, linear systems, mesh refinement, dynamic load balancing, and random field conditioning. Effective ways to handle such problems in parallel will be discussed.

MS7/Arboretum 1

Optimization and Parameter Estimation Problems In Porous Media

Optimization and parameter estimation methods are used in porous media problems to determine values of model parameters in reservoir characterization and control variables in aquifer remediation design. In reservoir characterization problems, permeability and porosity fields are sought, constrained by laboratory tests and sparse field data. In aquifer remediation problems, well locations and pumping rates are sought, constrained by cleanup standards. Theoretical and computational aspects of these problems, such as nonconvexity and ill-posedness, make their solution challenging.

In this minisymposium, the speakers will address many of the current mathematical and computational challenges and problems in porous media optimization and parameter estimation problems. In recent years, solution techniques in this area have moved beyond the use of linear and nonlinear programming optimization techniques on sequential computers to the use of dynamic programming, optimal control, genetic algorithms and simulated annealing on parallel computers. The speakers will highlight and present these emerging areas of research.

Organizers: Daene C. McKinney, University of Texas, Austin and Marcelo Ramé, Rice University

3:15 Aquifer Parameter Identification by Simulated Annealing
James G. Uber, University of Cincinnati

3:45 Application of numerical Optimization to Remediation Design with Recharge at a Superfund Site

David P. Ablfeld, University of Connecticut, George F. Pinder, University of Vermont, and R. H. Page, Environ Corporation, Princeton 4:15 Nonlinear Programming Approaches to Parameter Identification for Flow in Porous Media

John E. Dennis, Jr. and *Robert Michael Lewis*, Rice University

4:45 Groundwater Optimization Using Genetic Algorithms

Daene C. McKinney, Organizer, and Min-Der Lin, University of Texas, Austin

MS8/Arboretum 2

Computational Advances in Modeling of Surface Water Flow

Modeling of flow and circulation in tidal and non-tidal regions requires that the hyperbolic balance equations of mass and momentum be solved on the computer. The problem is made difficult by the nonlinearities in the flow, the large amounts of measured and computed data that must be manipulated, the complex geometries that must be discretized. As a result, efficient computational algorithms are needed. The speakers in this session will provide insight into the current directions and methodologies that are being employed in surface water flow.

Organizer: William G. Gray University of Notre Dame

3:15 Continuity Considerations in Shallow Water Modeling

Randall L. Kolar and William G. Gray, University of Notre Dame

3:45 A Predictive Model of Ocean Surface Currents Robert O. Reid, Texas A&M University

4:15 Pre- and Post-processors for Surface Water Models: the Route Towards Expert Systems

> Antonio M. Baptista and Paul J. Turner, Oregon Graduate Institute of Science and Technology

4:45 Assessing the Physics of Coastal Flow Models by Examining the Spectral Distribution of Non-linear Tides Rick A. Luettich, University of North Carolina, Chapel Hill and Joannes J. Westerink, University of Notre Dame

MS9/Arboretum 3

Numerical Techniques for Computation of Ground Water Flows

This minisymposium addresses both practical and theoretical problems in the computation of advectivediffusive flows arising in subsurface, porous media fluid transport. These problems are highly relevant in environmental science and engineering, for example, in the prediction and control of the flow of ground water contaminants or waste treatment. Realistic numerical simulations are extremely complicated due to severe nonlinearity, multiscale behavior, complicated geometry of the subsurface, and potential heterogeneity in permeability or porosity. The speakers in this minisymposium will discuss the development of new finite element/finite volume techniques, describe recently developed codes for groundwater transport, front-tracking methods for fine scale simulations of fluid instability, and discuss theoretical convergence questions for finite difference techniques for multiphase, heterogenous porous media flow problems.

Organizers: Kenneth Clark, US Army Research Office Research and Jeffrey Holland, US Army Waterways Experiment Station

3:15 A Control-Volume Eulerian-Lagrangian Localized Adjoint Method for Simulation of Ground Water Flows

Thomas F. Russell, University of Colorado, Denver and Richard W. Healy, U.S. Geological Survey, Denver 3:45 The SECO Codes for Groundwater Flow, Particle Tracking, and Radionuclide Transport

Patrick J. Roache, Ecodynamics, Albuquerque
4:15 Discontinuity Resolution in Groundwater

W. Brent Lindquist, State University of New York, Stony Brook

4:45 Multiscale Flow in Porous Media and Heterogeneities
Jim Douglas, Jr., Purdue University, West Lafayette

MS10/Arboretum 4

Nonlinear Phenomena in Geochemical Systems: Homogenization, Bifurcation, and Numerical Approaches (Part 2 of 2)

(For description, see MS 5, Page 6) Organizer: Peter J. Ortoleva Indiana University, Bloomington

- 3:15 Mechano-Chemical Pressure Seals in a Sedimentary Basin: A Computational Homogenization Approach Peter J. Ortoleva, Organizer
- 3:45 Fluid Flow in Restricted Geometries: Scaling Behavior for Permeability Ping Sheng, Exxon Research and Engineering Company, Annandale, NJ
- 4:15 Oscillatory Intracrystalline Zoning
 Jun Mu, Indiana University, Bloomington

CP3/Arboretum 5

Porous Media Modeling I

Chair: Bryan J. Travis, Los Alamos National Laboratory

3:15 A Collocation-Based Interface Relaxation Domain Decomposition Algorithm to Solve Multiphase Flow and Contaminant Transport Problems in Porous Media

> Joseph Guarnaccia and George Pinder, University of Vermont

3:35 Analytic Modeling of Three-Dimensional Flow in Unconfined Aquifers with Recharge

Glenn Ledder and Vitaly Zlotnik, University of Nebraska, Lincoln
Characteristics Analysis and Splitting

Algorithm of Waterflooding in Naturally
Fractured Reservoirs
Zhi-an Luan, Petroleum University, Shan-

4:15 Integrated Core Analysis Study of a Sandstone Formation in Central Oman Mohammed Zubair Kalam, Sultan Qaboos University, Sultanate of Oman

Dong, People's Republic of China

- 4:35 Convection in Tabular Magma Bodies Surrounded by Cold, Conducting Rock Bryan J. Travis and Greg A. Valentine, Los Alamos National Laboratory
- 4:55 Analysis of Flow Regimes in Displacement Processes in Porous Media
 Y.C. Yortsos, University of Southern California

CP4/Redbud Room

Seismic and Inverse Imaging Chair: William W. Symes, Rice University

- 3:15 Inversion of Crosswell Seismology by Differential Semblance Analysis

 Hua Song and William W. Symes, Rice
 University
- 3:35 Interactive 3D Seismic Data Analysis and Display on a Massively Parallel Distributed-Memory Machine Emilio Camahon, University of Texas, Austin; and Indranil Chakravarty, Schlumberger Laboratory for Computer Science
- 3:55 Numerical Inversion for Three Dimensional Induced Polarization
 D. Moseley and H. Rasmussen, University of Western Ontario, Canada; and P. Forsyth, Jr., University of Waterloo, Canada
- 4:15 An N 1.5 Algorithm for Solving the Volume Integral Equation

 Weng Cho Chew and Cai-Cheng Lu,
 University of Illinois, Urbana
- 4:35 Nonlinear Interface Conditions in Modeling Elastic Wave Propagation
 John E. Spitler, University of Wyoming; James S. Sochacki, James Madison University; and Richard E. Ewing, Texas A&M University, College Station
- 4:55 Waveform Inversion through MBTT
 Formulation
 Francois Clement, INRIA-Rocquencourt,
 France and Guy Chavent, University of ParisDauphine, France
- 5:15 Initial Boundary Problems for Anisotropic Equations Yaroslav V. Kurylev, POMI, Russia and Purdue University
- 5:35 Simultaneous Determination of Sounding Signal and Wave Propagation Velocity Alexander V. Avdeev, Computing Center, Novosibirsk, Russia

6:00 PM-7:00 PM/Window Box Meet-and-Greet Hour

Join the SIAM Activity Group on Geosciences

The SIAM Activity Group on Geosciences provides an interactive environment wherein modelers concerned with problems of the geosciences, e.g., petroleum exploration and recovery, clean-up of hazardous waste, and earthquake prediction, can share their problems with algorithm developers, applied mathematicians, numerical analysts, and other scientists. Members include computer scientists, environmental engineers, geologists, geophysicists, geostatisticians, hydrologists, mathematicians, and petroleum engineers. Topics of interest include flow in porous media, multiphase flows, phase separation. wave propagation, combustion, reactive flows, sedimentation and diagenesis, and rock fracturing. SIAM has conducted three conferences on the geosciences. A biannual newsletter is sent to all members. Mary F. Wheeler, Chair.

To join, SIAM members should contact: SIAM Customer Service 3600 University City Science Center Philadelphia, PA 19104-2688 Call toll free in USA: 800-447-SIAM Outside USA call: 215-382-9800 Fax 215-386-7999 E-mail: service@siam.org

TUESDAY MORNING, APRIL 20

7:30/Regency Foyer Registration opens

8:30/Regency Room

IP4/Chair: William W. Symes, Rice University Recent Progress in Seismic Imaging for Reservoir Analysis

It is likely that the majority of the world's remaining oil and gas resources are to be found within the existing known reservoirs. New developments in seismic tomographic imaging and other interwell imaging technologies are beginning to permit detailed examination of the physical state of the reservoir with acceptable levels of resolution. These developments require sophisticated new mathematical approaches to imaging in diffractive media, modeling in poroelastic and viscoelastic media, and development of theoretical relationships that relate geophyscial measurements to rock properties and reservoir parameters. The speaker will discuss the challenging and exciting demands of some of these new areas of research and their impact on new developments in computational mathematics.

James H. Justice Justice Associates, Inc. Addison, Texas

9:15/Regency Room

IP5/Chair: Daniel M. Tetzlaff, Texaco, Houston Predicting Versus Interpreting: A Survey of Oil Recovery Modeling

Numerical simulation, now the preeminent analytical tool in hydrocarbon recovery technology, has evolved through three phases: improving numerical accuracy, large-scale computing, and reservoir characterization. Because of the tremendous advances in computing hardware, simulation is on the brink of yet another phase, the efficiency phase. In the efficiency phase, it is recognized that the complexity (and expense) of a solution must be matched to the size of the problem being solved. Given the near-universal access to large-scale computing, the expense will be tied more to a practitioner's effort than to computing expenses.

In this presentation, the speaker will focus on aspects of numerical simulation that have been developed to bring about this efficiency: the use of predictive models, geostatistics, and the so-called hybrid streamtube approaches.

Larry W. Lake

Department of Petroleum Engineering The University of Texas, Austin

10:00/Window Box Coffee

10:30 AM-12:30 PM Concurrent Sessions

MS11/Regency Room

Vectorization and Parallelization in Reservoir Simulation

The simulation of processes occurring in oil and gas reservoirs is computationally intensive. Depending upon the physics of the process being simulated, it may be important to resolve behavior at small length scales, due either to fluid behavior or to heterogeneity of rock properties. Increasing speeds of single-processor computers have not sufficiently improved resolution of these systems, which are still generally modeled using lumped properties. In this minisymposium, the speakers will address the issue of taking full advantage of new and emerging computer architectures to vectorize and/or parallelize reservoir simulation codes to allow more detailed processes to be modeled.

Organizers: Richard T. Mifflin, Exxon Production Research Co., Houston, and Kamy Sepehrnoori, University of Texas, Austin

10:30 Seismic Scale Reservoir Simulation on the Connection Machine

Kenneth M. Brantferger and Bret L. Beckner, Mobil Exploration and Production Technical Center, Dallas

- 11:00 Vectorizing and Parallel-Processing the Linear Equation Solver for the Local-Grid-Refinement Reservoir Simulation Model Mark C.H. Chien and D. R. Jones, Chevron Petroleum Technology Company, La Habra, CA
- 11:30 Parallel Reservoir Simulation
 Philip T. Keenan, Rice University, and Jon
 Flower, ParaSoft Corporation, Pasadena, CA
- 12:00 A Parallel Chemical Flood Simulator: Investigation on Distributed Memory Processors

Marcelo Ramé, Todd Arbogast, Clint N. Dawson and Mary F. Wheeler, Rice University

MS12/Arboretum 1

Seismic Imaging and Inversion: Resolution, Geological Constraints, and Algorithms (Part 1 of 2)

Seismology provides the most detailed picture of the earth's structure available for petroleum exploration and production. It is the primary tool used by geophysicists to locate and map likely oil and gas plays, and is of increasing importance in advanced production techniques (enhanced oil recovery). Both imaging (the inference of structure) and inversion (the estimation of detailed predictive mechanical models) are active research areas. Some physical features of the subsurface are well-determined by seismic means, whereas others are not. In precision applications such as reservoir characterization and flood monitoring, it is as important to know what is not well-resolved as it is to have "an answer". Also unconstrained inversion results are likely to be geologically senseless. Since the mechanical parameters are nonlinearly related to the data, detailed understanding of resolution is difficult and rather recent. Geological "constraints" are likely to be qualitative in nature, therefore difficult to apply directly to pin down seismically unresolved features. In this minisymposium, the speakers will survey recent work in resolution, nonlinearity and constraints in the seismic context. They will address statistical (Bayesian) and deterministic sensitivity analysis of travel-time and waveform data, the influence of nonlinearity (velocity estimation and multiple reflections), and deterministic and statistical imposition of extra-seismic constraints.

(See MS17, Page 10 for Part 2)

Organizer: William W. Symes, Rice University

10:30 On the Determination of Slowness and Depth in Seismic Reflection Tomography Kenneth P. Bube, University of Washington, and Robert T. Langan, Chevron Oil Field Research Company, La Habra, CA

11:00 Robustness and Regularization for Objective Functions Stephen F. Elston, Mobil Exploration and

Production Technical Center, Dallas

11:30 To Bayes or Not to Bayes: Statistical
Inference for Large-Scale Seismic Inverse
Calculations
John A. Scales, Colorado School of Mines

12:00 Steering Through the Null Space: The Specification of Constraint Matrices with Interactive Graphic Tools

Christof Stork, Advance Geophysical Corporation, Englewood, CO

MS13/Arboretum 2

High Resolution Ocean Modeling

The theme of the minisymposium is the necessity for performing systematic grid convergence studies (space and time) in ocean modeling. Such studies (or alternately, solution adaptive grid generation methods with reliable error estimates) are required in principle for any ODE or PDE study, as is generally acknowledged (certainly for nonlinear problems). In practice it is relatively rare, especially in geophysical simulations.

In this minisymposium, the speakers will demonstrate the methodologies for performing grid convergence studies and emphasize aspects of the geophysical results which would be qualitatively misleading if evaluated with inadequate grid convergence studies.

Organizers: Patrick L. Roache, Ecodynamics, Albuquerque, and David E. Dietrich, Institute for Naval Oceanography, Stennis Space Center Detachment, Mississippi

10:30 The Importance of Horizontal Resolution in Coupled Ice/Ocean Models of the Arctic

Steve Piacsek and R. Allard, Naval Research Laboratory, Stennis Space Center Detachment, Mississippi

11:00 Grid Convergence Studies for Coastal Ocean Models

Joannes J. Westerink, University of Notre Dame, and Rick Luettich, University of North Carolina, Chapel Hill

11:30 Coupling Flow and Transport Models for Highly Resolved Grids
Antonio Baptista, Oregon Graduate Institute of Science and Technology

12:00 A Numerical Study of Small-Scale Continental Shelf Features and their Interactions with Deep Water Flows David E. Dietrich, Organizer

MS14/Arboretum 3

Simulation of Porous Media Flows and Contaminant Transport in Geological Waste Repositories (Part 1 of 2)

This minisymposium will address three critical issues in the modeling of waste repositories: 1) the use of adaptive logically rectangular grids; 2) the modeling of porous media flows in the resulting grids; and 3) the modeling of contaminant transport in the resulting flows. It is important to adapt grids to both special features of the repository such as wells and to adapt grids to the variability in the geologic structure of the repository. Using adaptive grids then complicates the modeling of the porous media flow; both finiteelement and finite-difference methods can be used to handle resulting complexities. The contaminant transport can be approximated using finite-volume based algorithms based either on a generalized method of characteristics or on generalized high-resolution total-variation diminishing algorithms.

(See MS21, page 10 for Part 2)

Organizers: Thomas H. Robey, Spectra Research Institute/Sandia National Laboratories, Albuquerque and Stanley Steinberg, Ecodynamics Research Associates, Inc. and University of New Mexico, Albuquerque

10:30 Computational Issues in Modeling Ground Water Flow and Contaminant Transport

Thomas H. Robey, Stanley Steinberg, Organizers, et al. (This talk will be developed by all of the participants in this minisymposium).

- 11:00 Geostatistics and Upscaling of Hydrologic Properties for an Adaptive Mixed Finite Element Method Applied to Unsaturated Porous Media Flow Thomas H. Robey, Organizer
- 11:30 Grid Adaption to Hydrodynamic
 Dispersion or Conductivity Tensors
 Patrick Knupp, Ecodynamics Research
 Associates, Albuquerque
- 12:00 Sources of Numerical Instability in Transport Simulations in Dual Porous Media

Kambiz Salari, Ecodynamics Research Associates, Albuquerque

MS15/Arboretum 4

Homogenization for Flow and Transport through Porous Media

Homogenization is a method that allows rigorous derivation of averaged macro models on larger scales from micro models on small scales. This is important for media with microstructure and for heterogeneous media.

Darcy's law is well established for single phase flow in porous media; for multiphase flow a rigorous justification of the concept of relative permeabilities is missing. For fractured porous media special models are needed that describe the interplay between different regimes with small and large permeabilities.

In this minisymposium, the speakers will present various applications of the method of homogenization and demonstrate its usefulness.

Organizer: Ulrich Hornung, University of the Federal Armed Forces, Munich, Germany

10:30 Computational Justification of a Dual-Porosity Model for Two-Phase Flow in Fractured Media

Todd Arbogast, Rice University

11:00 Homogenization Methods for Modeling
Transient Stokes Flows in Porous Media
Greg Allaire, Commissariat a l'Energie
Atomique-DRN/DMT/SERMA, France

11:30 Models for Flow and Transport through Porous Media Derived by Homogenization Ulrich Hornung, Organizer

12:00 Secondary Flux in Partially Fissured or Layered Media
Ralph Showalter, University of Texas, Austin

CP5/Arboretum 5

Finite Element Methods

Chair: James G. Uber, University of Cincinnati

10:30 Eulerian-Lagrangian Localized Adjoint Method for Contaminant Transport and Biodegradation

Richard E. Ewing and *Hong Wang*, Texas A&M University, College Station; and Michael A. Celia, Princeton University

10:50 Eulerian-Lagrangian Localized Adjoint Methods for Convection-Diffusion Problems in Multidimensions

Magne S. Espedal, University of Bergen, Nor-

Magne S. Espedal, University of Bergen, Norway; Richard E. Ewing and *Hong Wang*, Texas A&M University, College Station; and Helge K. Dahle, University of Bergen, Norway

11:10 Comparison of Hopscotch and Conjugate Gradient Techniques for Transient 3-D Porous Media Flow Problems

James G. Uber, University of Cincinnati

11:30 Velocity Computations for Streamline Computations
Tore Gimse, University of Oslo, Norway

11:50 A Block Sparse Direct Method for Fully Implicit Hydrocarbon Reservoir Simulation

A.S. Harouaka, KFUPM/RI, Saudi Arabia; and T. Ertekin, Pennsylvania State University, State College

12:10 Local Grid Refinement for Reservoir Simulation Applications

L. Chu, J.C. Diaz, M. Komara, and A.C. Reynolds, University of Tulsa

CP6/Ebony Room

Modeling II

Chair: Angela Pawell, Oregon State University

10:30 Effective Behavior of Two-Phase Flow in Highly Heterogeneous Porous Media Alain P. Bourgeat and Abdelkader Hidani, University of St. Etienne, France

- 10:50 Transport of Reacting Solutes in Porous Media Affected by Chemical Equilibrium Angela Pawell, Oregon State University; and Klaus-Dieter Krannich, Technical University, Cottbus, Germany
- 11:10 Analytical and Numerical Prediction of Unsteady Drawdown from a Finite Reservoir to an Infinite Reservoir Lawrence J. De Chant, NASA Lewis Research Center
- 11:30 Analytical Solution of a General Potential Problem Developed for Applications to 2D-Reservoir Streamtube Models Gotskalk S. Halvorsen, Institute for Energy Technology, Norway
- 11:50 Analysis of Jump Phenomena of Unsaturated Infiltrating Flow by Air Spring Model
 Takao Nakayama and Yuzo Yamane, Ashikaga Institute of Technology, Japan

TUESDAY AFTERNOON, APRIL 20

12:30-2:00 Lunch

2:00/Regency Room

Chair: Richard A. Tapia, Rice University Panel Discussion on Recognition and Rewards in Mathematics

Many demands are being made on our universities and colleges: Improve undergraduate education, contribute to the rescue of our K-12 school systems, help our industries become more competitive are only some of these demands. In response to these demands the Joint Policy Board for Mathematics (JPBM) established the Committee on Professional Recognition and Rewards chaired by Calvin Moore of the University of California. Its charge is to make recommendations concerning the rewards and recognition structure in Mathematics departments in universities and colleges that respond to these demands.

Richard Tapia, a member of the committee will describe the activities of the committee and present preliminary findings. An open discussion will follow.

Richard A. Tapia and **J.E. Dennis, Jr.**, Discussants Department of Mathematical Sciences, Rice University

2:45/Window Box Coffee

> 3:15-5:15 PM Concurrent Sessions

MS16/Regency Room

Efficient and Accurate Determination of Fluid Velocities

Effective transport of fluids in porous media depends strongly upon the accuracy of the techniques for determining the fluid velocity. The heterogeneity of the porous media, on many length scales, greatly complicates the velocity calculations since, in general, the velocity is determined through some version of d'Arcy's law. Mixed finite element, finite volume, and cell-centered finite difference methods will be discussed for the velocity and pressure approximation. These techniques can effectively treat the discontinuous and rapidly-varying permeabilities.

Due to the large size of field scale simulations, efficiency is also of critical importance. Effective preconditioners built from domain decomposition and multi-level techniques combined with multi-grid solvers will be discussed. These methods hold enormous potential for many applications from petroleum reservoir simulation, to the modeling of transport and remediation of contamination of groundwater.

Organizer: Richard E. Ewing Texas A&M University, College Station

- 3:15 Preconditioning Techniques for Conforming Finite Element Methods Joseph E. Pasciak, Brookhaven National Laboratory
- 3:45 Mixed Finite Element Methods and Block Finite Difference Methods for Accurate Computation of Fluid Velocities with Discontinuous Permeabilities Richard E. Ewing, Organizer; Patrick O'Leary, University of Wyoming, Laramie; and J. Shen, Texas A&M University
- 4:15 A Mixed Finite Volume Element Method for Accurate Computation of Fluid Velocities on Irregular Quadrilateral J. Jones, S. McCormick, and T. Russell, University of Colorado, Denver, and Z. Cai, University of Southern California
- 4:45 Application of Mixed Finite Elements to the Calculation of the Effective Permeability of Heterogeneous Porous Media

Louis J. Durlofsky, Chevron Oil Field Research Company, La Habra, CA MS17/Arboretum 1

Seismic Imaging and Inversion: Resolution, Geological Constraints, and Algorithms (Part 2 of 2)

(For description, see MS12, Page 8) Organizer: William W. Symes, Rice University

- An Inverse Scattering Method for 3:45 Multiple Supression Arthur B. Weglein, ARCO Exploration and Production Co., Plano, TX
- 4:15 Algorithms and Regularization for Traveltime Tomography Kenneth P. Bube, University of Washington, and Robert T. Langan, Chevron Oil field Research Co., La Habra, CA
- **Objective Functions for Velocity** 4:45 Inversion William W. Symes, Organizer

MS18/Arboretum 2

The Impact of Ocean Waves on Coastal Regions

Coastal regions are exceedingly energetic zones in which wave energy from the ocean surface is concentrated, dissipated and reflected. When waves begin shoaling in coastal regions they experience significant nonlinear distortions and wave-wave interactions before ultimately breaking and running up on beach faces. Turbulence, air entrainment, and sediment entrainment occur in consequence of wave breaking. Currents are also generated that move sediment in the cross-shore and longshore directions so that the local bathymetry is significantly altered. In this minisymposium, the speakers will discuss mathematical aspects relating to such physical processes. In particular, attention will be paid to the three-dimensional evolution of waves up to and subsequent to breaking, and to currents and sediment transport in the surfzone.

Organizers: Joseph L. Hammack and William G. Pritchard, Penn State University, University Park

- **Wave Design in Shallow Waters** S.J. Buchan, Steedman Science and Engineering, Western Australia
- **Wave Breaking and Surfzone Dynamics** 3:45 I. Svendsen, University of Delaware
- **Mathematical Modeling of Nearshore** 4:15 Wave Propagation P. Liu, Cornell University
- The Kadomtsev-Petviashvili Equation 4:45 and Water Waves Harvey Segur, University of Colorado, Boulder

MS19/Arboretum 3 Simulation of NAPL Groundwater Contamination

Many sites in the industrial world have been contaminated by non-aqueous phase liquids (NAPL). Gasoline storage tanks, petrochemical refineries, and fertilizer manufacturing are typical sources of these contaminants. Numerical modeling is an important tool for design of efficient remediation processes. This minisymposium will discuss various issues which arise in numerical simulation of multiphase subsurface NAPL flows. Modeling of spill scenarios, as well as remediation (thermal and isothermal vapour estraction) will also be discussed. The speakers will address both numerical issues and application of simulation models to real sites.

Remediation of NAPL contaminated sites is a topic of growing interest in the groundwater community.

Many techniques for remediation (gas venting, steam injection, chemical flood) are being used experimentally, with very little stimulation being carried out. This minisymposium will bring together representatives from industry, academia, and government laboratories to discuss the difficulties in numerical simulation of these processes, and the practical benefits to be gained from modeling.

Organizer: Peter A. Forsyth University of Waterloo, Canada

Applying Simulation Models to Assess NAPL Behavior for Site Characterization and Remediation

Everett P. Springer, Los Alamos National Laboratory

- A Unified Approach for Simulating NAPL 3:45 Migration in the Subsurface Yu Shu Wu and Peter S. Huyakorn, S. Panday, and N-S. Park, HydroGeoLogic Inc., Herndon, VA
- Positive Coefficient Discretizations for 4:15 Simulation of NAPL Remediation Peter A. Forsyth and Bei Yu Shao, University of Waterloo, Canada
- Modeling of NAPL Infiltration into 4:45 **Heterogeneous Soils** Karsten Pruess, Lawrence Berkeley Laboratory

MS20/Arboretum 4

Hyperbolic Systems in Porous Media

The theme of this minisymposium is the mathematical properties of hyperbolic systems of conservation laws arising in porous media flow. In particular, attention will be focused on the relation between properties of the systems and the performance of numerical methods. The speakers will discuss Riemann problems, Cauchy problems, questions of continuous dependence, stochastic systems and front tracking and other numerical techniques. They will describe some recent results on hyperbolic systems of conservation laws, and explain the consequences of these results for numerical computations.

Organizer: Ragnar Winther University of Oslo, Norway

- **Chromatography Theory of Gas Injection Processes for Enhanced Oil Recovery** Franklin M. Orr, Stanford University
- Convergence of a Godunov Method for a **Resonant System of Conservation Laws** Eli Isaacson, University of Wyoming
- Fluid Flow in Stochastic Porous Media Helge Holden, University of Trondheim, Norway
- Front Tracking and Operator Splitting for Hyperbolic Conservation Laws Aslak Tveito, Center for Industrial Research, Norway

MS21/Ebony Room

Simulation of Porous Media Flows and Contaminant Transport in Geological Waste Repositories (Part 2 of 2)

WEDNESDAY MORNING, APRIL 21

7:30/Regency Foyer Registration opens

8:30/Regency Room IP6/Chair: Ronald F. Peierls, Brookhaven National Laboratory Climate Stability and Nonlinear Dynamics

Warmer temperatures of recent years, and rising concentrations of greenhouse trace gases have produced heightened concern, in the scientific community and the public, about the possibility of a substantially warmer climate in the next century. In the 1970's, a few years of cooler temperatures and rising concentrations of anthropogenic aerosols generated a similar level of concern about the possibility of an impending ice age.

The climate system is an aggregate of subsystems — atmosphere, oceans, ice, biosphere and bedrock — with different characteristic time and space scales. The processes dominating climatic change are radiation balance, the hydrologic cycle, biogeochemical cycles and, on longer time scales, the slow flow of ice sheets and isostatic bedrock adjustment. This system, with its subsystems and processes, is subject to various external forcings - volcanic eruptions, solar variability, anthropogenic changes in atmospheric composition, orbital changes and tectonic plate motions, among others.

The speaker will present an overview of current knowledge on the stability of the Earth's climate. He will discuss simple equilibrium behavior, self-sustained, purely-periodic oscillations and forced, aperiodic oscillations. The time scale highlighted in this review will be that of Quarternary glaciation cycles - thousands to million of years. From this longer, more dispassionate perspective, the speaker will draw inferences about the interplay to be expected on the decades-to-centuries time scale between internal climate variability and anthropogenic trace-gas forcing. The key question is whether human forcing will succeed in destabilizing climate where larger forces have apparently failed.

Research Company
A Review of Current Trends in
Petroleum Reservoir Simulation and
Assessment of the Impacts on Oil
Recovery

The speaker will present a general overview of current trends in petroleum reservoir simulation and the impacts associated with heterogeneous reservoir descriptions. He will discuss the nature of heterogeneities and the concept of scale sizes, the problems of averaging parameters and flow functions for the equations of motion in the context of core scale observations, and the significance of wettability and capillary pressure variations. He will describe methods for generating heterogeneities, review the techniques available for determining effective properties in both absolute and relative permeabilities, and summarize the problems of sensitivities of the anisotropic permeability tensor to the choice of boundary conditions. Finally he will describe an approach to simulating large reservoirs based on a synthesis of heterogeneous cross sections and streamtube methods.

MS23/Arboretum 1 Reservoir Characterization

The detailed structure of an oil or gas reservoir can play an important role in the amount of hydrocarbon recovered. In determining the economic potential of a reservoir process, the variance in the expected recovery can be nearly as important as the most probable recovery. An accurate description of the rock properties can be critical in this regard. However, reservoir data are of limited availability and of varying accuracy and scale of resolution. Previous techniques have ignored much of the detail of the reservoir rocks, lumping the properties by various approximate or phenomenological techniques. In this minisymposium, the speakers address the issues involving the development of statistics appropriate for characterizing reservoir rocks and the use of those statistics to generate faithful realizations of rock properties.

Organizers: Richard T. Mifflin, Exxon Production Research Co., Houston, and Kamy Sepehrnoori, University of Texas, Austin

10:30 Analysis of Random Function Models in Terms of Spatial Entropy

Clayton V. Deutsch and Marshall L. Grant, Exxon Production Research Company, Houston

11:00 Application of Genetic Algorithm to Reservoir Description

M. Kelkar and X. Huang, University of Tulsa

11:30 Stochastic Modeling of Reservoir Facies
Naji Saad and Cindy T. Kalkomey, Mobil
Research and Development Corporation, Dallas

12:00 Quantifying the Architecture of Heterogeneous Reservoirs

Noel Tyler, University of Texas, Austin

MS24/Arboretum 2 Some Aspects of Porous Media Research in the Netherlands

This minisymposium brings together a number of researchers, working in the Netherlands on a variety of disciplines related to flow in porous media. The first speaker is J. Bruining, who considers interface models for steam drive recovery of oil. In particular he will compare the outcome of the theory with experiments done at the Dietz Laboratory. The second speaker is S.M. Hassanizadeh, who will present a new theory describing two phase flow in porous media, taking into account interfacial areas. Then W.A. Mulder will speak on operator splitting techniques, carried out on a locally refined grid, and applied to, two phase flow including gravity. Finally, C.I. van Duijn will present the results of an analytic study concerning the decay of a pulse in the transport of reactive solutes through a porous medium.

Organizer: C.J. van Duijn Delft University of Technology, the Netherlands

10:30 Interface Models for Steam Drive Recovery of Oil; Inclusion of Heat Losses
J. Bruining, Delft University of Technology, the Netherlands

11:00 Application of a New Theory of Two Phase Flow in Porous Media to Modeling the Unsaturated Zone S.M. Hassanizadeh, National Institute of

S.M. Hassanizadeh, National Institute of Public Health and Environmental Protection, Bilthoven, the Netherlands

11:30 On the Use of Operator Splitting for Twophase Porous Media Flow with Gravity W.A. Mulder, Shell Research - KSEPL, Rijswijk, the Netherlands

12:00 Asymptotic Profiles in Contaminant Transport C.J. van Duijn, Organizer

MS25/Arboretum 3 Biodegradation, Dissolution and Other Forms of Reactive Flow and Transport

Environmental restoration of soils and groundwater to required national and state standards will continue to be a challenge for decades to come. In recent years, emphasis has shifted to the development and deployment of in-situ remediation techniques, whereby a physical, chemical or biological reaction is invoked to breakdown, dissolve or sometimes make insoluble contaminants disposed there by accident or intent. In this minisymposium, the speakers will explore techniques to simulate these complex processes, to successfully bring them to the field, and to understand how they work. They will address the mathematical and computational difficulties that must be accommodated, including sharp fronts, nonlinear phenomenon and widely disparate time scales.

Organizer: Kyle Roberson Pacific Northwest Laboratory

10:30 3-D Bioremediation Simulations:
Numerical Methods and Field
Remediation Design Applications
Brian D. Wood, Pacific Northwest
Laboratory, Richland, WA and A. Chilakapati,
Rice University

11:00 A Simulation Approach Capable of Treating Either Equilibrium or Kinetically Controlled Reactive Transport in Groundwater John C. Friedly, University of Rochester

- 11:30 Numerical Simulation of 3-Dimensional Hydrothermal Circulation with Precipitation Dissolution Effects

 Bryan J. Travis, David R. Janecky, and Nina D. Rosenberg, Los Alamos National
- Laboratory

 12:00 Incorporation of Observed Velocity
 Variations into Models of Contaminant

Transport at the Moffett Field Groundwater Test Site Margaret M. Lang, Lew Semprini, P. V. Roberts, and G. D. Hopkins, Stanford University

10:30 AM-12:30 PM/Window Box

Poster Session 1

(continued from Tuesday afternoon)

CP8/Arboretum 4

Atmospheric Modeling

Chair: Michael Ghil, University of California, Los Angeles

10:30 Optimal Control for Numerical Weather Prediction

Francois-Xavier Le Dimet, Universite Joseph Fourier, France

10:50 On the Numerical Difficulties and Remedies in the Finite Element Solution of Thermal Plumes with Strongly Temperature- Dependent Viscosity David L. Coulliette, Air Force Institute of Technology and Manfred Koch, Florida State University

11:10 Contaminant Sedimentation Conditions Evaluation

Michael M. Medvedev, Russian Academy of Sciences, Russia; and Anatoly B. Zolotukhin, Russian Academy of Sciences, Russia and Rogaland University, Norway

11:30 Simulations of Low Cloud Layers with Emphasis on Particle Physics and Aerosol Distribution

Yefim L. Kogan, Douglas K. Lilly, Zina N. Kogan and Victor V. Filyushkin, University of Oklahoma, Norman

11:50 Absorbing Boundaries for Chebyshev Pseudo-Spectral Methods

Rosemary A. Renaut, Arizona State University and Jochen Frohlich, University of Kaiserslautern, Germany

12:10 Solution to the Charney Problem of Viscous Symmetric Circulation

Ming Fang and Ka Kit Tung, University of Washington, Seattle

CP9/Arboretum 5

Parallel Algorithms

Chair: E.F. D'Azevedo, Oak Ridge National Laboratory

10:30 Overview of HPCC Groundwater Activities at the Oak Ridge National Laboratory E.F. D'Azevedo and C.H. Romine, Oak Ridge National Laboratory

10:50 Reservoir Simulations on KSR-1 Parallel Computers
Jianping Zhu, Mississippi State University

11:10 Parallel 3D Basin Modeling Code
Ruth Ann Manning and Paul D. Manhardt,
Computational Mechanics Corporation,
Knoxville; Lawrence M. Cathles, Cornell
University; and A.J. Baker, University of
Tennessee, Knoxville

11:30 Different Domain Decompositions at Different Times for Parabolic Problems
Daoqi Yang, Purdue University, West
Lafayette

11:50 Application of Domain Decomposition in Solving Problems of Contaminant Transport in Fractured Rock

Tom Clemo and Leslie Smith, University of

British Columbia, Canada

12:10 A Domain Decomposition Technique for Certain Free Boundary Problems

Caroline A. Papadopoulos and James M.

Sloss, University of California, Santa Barbara

0

WEDNESDAY AFTERNOON, APRIL 21

12:30-2:00 Lunch

2:00/Regency Room

IP8/Chair: Mary F. Wheeler, Rice University

Macrodispersion for Flow in Porous Media

Macrodispersion is based on heterogeneity. Geological heterogeneities on all length scales give rise to the scale dependence of macrodispersion. This scale dependence, which leads to the inability to determine field scale macrodispersion from laboratory data, is known as the scale up problem.

To account for scale up parameter uncertainties in the porous media flow equations, dispersion parameters are set approximately from field scale studies at other locations, i.e. from engineering correlations. They are also set from fine scale simulations based on statistical simulations of heterogeneous geology. These methods suffer from insufficient data and the expense of obtaining new data.

The speaker will present a multilength scale theory for macrodispersion based on asymptotic analysis of the advection equation for a random velocity field, and compare this theory with results from the other methods (field data and simulations).

James G. Glimm

Department of Applied Mathematics and Statistics State University of New York, Stony Brook

2:45/Window Box Coffee

> 3:15-5:15 PM Concurrent Sessions

MS26/Regency Room

Numerical Algorithms for Modeling Transport Phenomena in Porous Media (Part 2 of 2)

(For description, see MS22, Page 11) Organizer: Mary F. Wheeler Rice University

3:15 Weak and Direct Eulerian-Lagrangian Localized Adjoint Methods for Nonlinear and Reactive Transport

Thomas F. Russell, Rick V. Trujillo, and David W. Dean, University of Colorado, Denver

3:45 A Characteristic-Mixed Method for Contaminant Transport and Miscible Displacement

Todd Arbogast, A. Chilakapati, and Mary F. Wheeler, Rice University

4:15 Study of Higher-Order Total Variation Diminishing Finite-Difference Schemes for Reservoir Simulation

Jianchun Liu, Gary A. Pope, and Kamy Sepehrnoori, University of Texas, Austin

4:45 Transport Methods for Highly Resolved Models of Heterogeneous Porous Media

David E. Dougherty, University of Vermont and Andrew F.B. Tompson, Lawrence Livermore National Laboratory

MS27/Arboretum 1

Transport in Media Which Possess Evolving Heterogeneity

Processes taking place over multiple scales of motion are the rule rather than the exception in natural porous formations. When there is no distinct separation of scales, nonlocal constitutive theories should be used to account for information propagation over the evolving heterogeneity. In this session, the speakers will present several nonlocal theories of transport, numerical experiments involving transport in fractal porous media, and a laboratory experiment aimed at verifying several transport theories for media with evolving heterogeneity.

Organizer: John H. Cushman Purdue University, West Lafayette

- 3:15 Nonlocal Theories of Flow and Transport Shiomo P. Neuman, University of Arizona
- 3:45 Numerical Experiments with Transport in Fractal Porous Media Stephen W. Wheatcraft, University of Nevada, Reno
- 4:15 Nonlocal Theories of Dispersion in Porous Media
 T. R. Ginn, Battelle Pacific Laboratory, Richland, WA
- 4:45 Fractal Analysis of Random Walks in Porous Media
 Robert A. Greenkorn, Purdue University, West Lafayette

MS28/Arboretum 2

Reservoir Simulation Research at INTEVEP, S.A.

In this minisymposium, researchers in various parts of the field of geoscience working at INTEVEP, Research and Development and Technical Support Institute of Petroleos de Venezuela, will present an overview of the recent developments in the area and highlight advances in modeling, algorithms and applications. Organizers: Saul Buitrago and Enrique Rodriguez INTEVEP, S.A., Venezuela

3:15 Sequential and Parallel Ordering
Techniques for Solving Linear Systems
Arising in Reservoir Simulation
Saul Buitrago, Organizer

3:45 Modeling the Porous Media by Means of Conditional Boolean Simulation
Gustavo Gedler, INTEVEP, S.A., Venezuela

4:15 A Mathematical Model of Microbial Enhance Oil Recovery Enrique Rodriguez, Organizer

4:45 Production Estimation on Well Subject to Cyclic Steam Injection
Douglas Rodriguez, INTEVEP, S.A., Venezuela

MS29/Arhoretum 3 Wavelet-Based Methods in the Geosciences

Wavelets are a mathematical development with well publicized impact in the worlds of signal and data processing and numerical analysis. The purpose of this minisymposium is to explore the applications of wavelets in the geosciences. Particular emphasis will be placed on wavelet-based numerical methods for solving partial differential equations relevant to seismology and reservoir simulation. The speakers will address mathematical and computational issues and discuss recent developments and new avenues of

Organizers: Siamak Hassanzadeh and Sergio Zarantonello, Fujitsu America, Inc., San Jose, CA

Wavelet-Based Algorithms for Linear Initial Value Problems

Bjorn Engquist, University of California, Los Angeles

6:00

Conference Adjourns

The speaker is shown in italics for papers with multiple authors, if known at press time. Contributed presentations are spaced twenty minutes apart, allowing fifteen minutes for each presentation and five minutes for discussion. Minisymposium presentations are spaced thirty minutes apart, allowing twenty-five minutes for each presentation and five minutes for discussion.

SIAM 1993 Conferences, Meetings, Symposia, Tutorials, and Workshops

Tutorial on Distributed Computing Using PVM and HeNCE

Marriott Hotel, Norfolk, VA

Organizer: Jack J. Dongarra, Oak Ridge National Laboratory and University of Tennessee, Knoxville

March 22-24, 1993 Sixth SIAM Conference on Parallel **Processing for Scientific Computing**

Marriott Hotel, Norfolk, VA

Sponsored by SIAM Activity Group on Supercomputing Organizer: Richard F. Sincovec, Oak Ridge National Laboratory

April 18, 1993

Tutorial on Parallel Computing with Applications to Linear Algebra

Hyatt Regency Hotel, Houston, TX Co-organizers: Todd Arbogast and Clint Dawson, Rice University

SIAM Conference on Mathematical and Computational Issues in the Geosciences

Hyaff Regency Hotel, Houston, TX Sponsored by SIAM Activity Group on Geosciences Organizer: James Glimm, State University of New York at Stony Brook

Second International Conference on Mathematical and Numerical Aspects of Wave Propagation

University of Delaware, Newark, DE Conducted by SIAM with the cooperation of INRIA Organizer: Ralph Kleinman, University of Delaware

July 8-10, 1993

Symposium on inverse Problems and Optimal Design in Industry

Wyndham Franklin Piaza Hotel, Philadelphia, PA Sponsored by ECMI and SIAM with the cooperation of IMA (Minnesota), INRIA, and SIMAI

July 12-16, 1993 SIAM 1993 Annual Meeting

Wyndham Franklin Plaza Hotel, Philadelphia, PA Abstract deadline: 2/5/93 Organizer: Gregory Kriegsmann, New Jersey Institute of Technology

August 4-6, 1993 SIAM Conference on Simulation and Monte **Carlo Methods**

Cathedral Hill Hotel, San Francisco, CA Organizer: Peter W. Glynn, Stanford University

August 15, 1993

Tutorial on Numerical Methods in Control, Signal and Image Processing

University of Washington, Seattle, WA Organizer: Biswa N. Datta, Northern Illinois University

ugust 16-19, 1993

Third SIAM Conference on Linear Algebra in Signals, Systems, and Control

University of Washington, Seattle, WA Sponsored by SIAM Activity Group on Linear Algebra Organizer: Biswa N. Datta, Northern Illinois University

November 1-5, 1993 Third SIAM Conference on Geometric Design

Radisson Tempe Mission Palms Hotel, Tempe, AZ Sponsored by SIAM Activity Group on Geometric Design Abstract deadline: 3/22/93

Co-organizers: Robert E. Barnhill, Arizona State University, and Rosemary E. Chang, Silicon Graphics Computer Systems

Contact SIAM's Conference Coordinator at 215-382-9800 for further information.

TRANSPORTATION INFORMATION

SHUTTLE SERVICE

From Hobby and Intercontinental Airports: The Airport Shuttle services both airports on a daily basis between the hours of 5:00 AM and 11:00 PM. The shuttle are blue and white buses. Airport Shuttle has a desk at both airports where tickets can be bought. The desks are located in both airports in the ground transportation areas near the baggage claim areas. The cost of a one way ticket from Intercontinental Airport is \$12.00 and \$6.00 from Hobby Airport.

O DRIVING

From Hobby Airport:

Take 45 North. Follow the downtown exit signs; exit at Pease and follow the exit ramp until you are headed west on Pease, which is a one way street. Go about 17 short city blocks and turn right on Louisiana. Stay on Louisiana for 3 blocks, then turn left on Polk; the Hyatt's driveway will be immediately on the right hand side.

From Intercontinental Airport:

Take 59 South. Exit at Capital; follow the exit ramp until you are headed west on capital, then turn left on Milam. Proceed 6 blocks and then turn right on Polk. The Hyatt's driveway will be approximately 1 block up on the right hand side of Polk.

CAR RENTAL

Dollar Rent A Car has been selected as the official car rental agency for this conference. Cars can be rented at Intercontinental and Hobby airports. The following unlimited mileage rates will apply between April 11 - 25, 1993. (These rates do not include refueling services, tax, optional collision damage waiver, and personal accident insurance.)

Type of Car	Daily Rate	Weekly Rate	
Economy	\$29.98	\$139.98	
Compact	\$30.98	\$149.98	
Intermediate	\$32.98	\$159.98	
Standard	\$35.98	\$179.98	
Luxury	\$46.98	\$269.98	

Reservations

We encourage you to make an advance reservation, since on-site availability cannot be guaranteed. Make reservations by calling **1-800-800-0044**. When making reservations, be sure to give the SIAM Reservation Code: **CCSIA6**. You should also mention that you are attending the SIAM Conference on Geosciences, April 19-21, 1993 in Houston, Texas, in order to receive the indicated rates.

- Cars can be picked up at both Hobby and Intercontinental airports at the Dollar Car Rental Desks located in the baggage claim areas of the airports, and must be dropped off at the same location.
- You must be 21 years of age and have a valid U.S. or international driver's license.
- You must have an American Express, Master Card, VISA or Diner's Club credit card in order to rent a car.

HOTEL INFORMATION

Hyaft Regency Houston 1200 Louisiana Street © Houston, TX 77002 © 713-654-1234

The Hyatt's prime location in the center of downtown places you in Houston's vibrant business and theatre district. You can enjoy the view from Hyatt's 30-story atrium lobby.

Room Rates

\$83.00 Single \$89.00 Double

There is a 15% occupancy tax that will added to your room rate.

Reservation Deadline

Monday, March 29, 1993

To make a reservation

- Use the Hotel Reservation Card on the back of this program or call the Hyatt Regency at (713)-654-1234.
- Identify yourself as an attendee at the SIAM Conference on Geosciences.
- · Be sure to request a confirmation number.

O Deposit

A deposit in the amount of one night's room rate or the use of a major credit card with its number and expiration date is required to confirm your reservation.

Cancellation

To obtain a refund, reservations must be cancelled by 5:00 PM, 48 hours prior to your scheduled arrival.

Arrivals and Departures

You may check in anytime after 3:00 PM; you must check out by 11:00 AM.

O Hotel Facilities

The hotel is equipped with a heated outdoor swimming pool. A full-service health club is located on the 6th floor by the pool deck. The concierge can arrange for you to play racquetball, tennis and golf. The hotel features a complimentary shuttle service that departs from the hotel lobby to and from the Galleria. The service is available on a daily basis from 10:00 AM to 9:00 PM Monday to Saturday and noon to 6:00 PM on Sundays. The Galleria shopping mall features over 250 specialty shops and restaurants.

Within Walking Distance

Directly connected to the Hyatt is the Tunnel System. A six mile system of underground pedestrian tunnels downtown including a variety of shops and restaurants connecting all major buildings. The American Institute of Architects, Tranquility Park, Houston's downtown theatre and cultural district covering 16 blocks are all within walking distance of the Hyatt.

Parkina

Regency Parking is located adjacent to the Hyatt. There is a walkway that connects the parking lot to the third floor of the hotel. A special discounted rate of \$5.50 has been established for SIAM conference attendees. Valet parking is available at the hotel at a rate of \$9.00 per day. Bring your parking ticket to the SIAM or Hyatt registration desk and mention that you are attending the conference and your parking ticket will be validated.

Babysitting Service

Babysitting service is available through the hotel's Concierge Desk by calling 713-654-1234. Babysitting is done in your room with the exception of Friday and Saturday evenings where the hotel features Camp Hyatt for children 3 - 15 years of age. The cost ranges between \$5-\$8 per hour for the first child and \$1 per hour for each additional child. SIAM supplies the information, but in no way takes responsibility or is liable for any damages that may occur by using any of the suggested services. It is the responsibility of the attendees to choose the service that best suits their needs.

© GET-TOGETHERS

SIAM Welcoming Reception

Sunday, April 18, 1993 6:30 PM - 8:30 PM Window Box

Cash bar and assorted mini hors d'oeuvres.

Meet-and-Greet Hour

Monday, April 19 6:00 PM - 7:00 PM Window Box

Come join your colleagues for some beer or sodas and some chips and dip while you talk about the day's events or make plans for dinner.

Cost \$5

Business Meeting SIAM Activity Group on Geosciences

Tuesday, April 20 8:00 PM Regency Room

Anyone who is interested in the SIAM/AG on Geosciences or who would like to join is welcome.

REGISTRATION INFORMATION

Please complete the Preregistration Form found on the back of this program. We urge attendees to register in advance to get the lower registration fee. The preregistration deadline is Monday, April 5, 1993. The registration desk will be located in the Regency Foyer and will be open as listed below:

Saturday, April 17	6:00 PM - 8:00 PM
Sunday, April 18	7:30 AM - 4:00 PM
	6:00 PM - 8:00 PM
Monday, April 19	7:30 AM - 4:00 PM
Tuesday, April 20	7:30 AM - 4:00 PM
Wednesday, April 21	7:30 AM - 2:00 PM

Fifth International Symposium on Domain Decomposition Methods for Partial Differential Equations

Edited by David E. Keyes, Tony F. Chan, Gerard Meurant, Jeffrey S. Scroggs, and Robert G. Voigt

Proceedings in Applied Mathematics 55

Conference held in Norfolk, Virginia in May 1991

Reflects the increased range and complexity of applications presented at the meeting through the presentations focusing on fluid mechanics, structures, biology, and design optimization. One of the important themes of the conference continues to be the role of domain decomposition in the numerical solution of partial differential equations on parallel systems.

If you were unable to attend this conference, here is your opportunity to catch up on the most recent research.

1992 / xiii + 623 pages / Soft / ISBN 0-89871-288-2 List \$74.00 / SIAM Member \$59.20 / Code PR55

The complete SIAM domain decomposition proceedings library is now available for a limited time at a special price. You can purchase all five volumes for only \$ 146.50 — a savings of 50%.

Proceedings of the Fifth SIAM Conference on Parallel Processing for Scientific Computing

Edited by Jack J. Dongarra, Ken Kennedy, Paul Messina, Danny C. Sorensen, and Robert G. Voigt

Proceedings in Applied Mathematics 62

Conference held in Houston, Texas, March 1991

This proceedings reflects the maturation of parallel processing. Anumber of papers included here describe applications now benefiting from parallel processing, and many feature parallel methods for partial differential equations. There are also papers on performance evaluation and on tools to aid in developing efficient programs to utilize the potential performance offered by parallel computing.

Another theme that receives considerable attention is simulation and modeling of complex systems. Of particular note is the presentation of several results in computational biology. An extensive discussion of performance evaluation from fine-grained analysis to job-stream analysis comprises a large portion of this volume. Perhaps the most important development, however, is the emergence of high quality numerical software and sophisticated programming environments and tools for parallel programming.

Royalties from the sale of this book are contributed to the SIAM Student Travel Awards fund.

1992 / xvii + 648 pp. / Soft / ISBN 0-89871-303-X List \$84.50 / SIAM Member \$67.60 / **Code PR62**

NOTICE

There will be no prorated fees. No refunds will be issued once the conference has started. If SIAM does not receive your Preregistration Form by Monday, April 5, 1993, you will be asked to register and pay the full registration fee for the conference.

© CREDIT CARDS

SIAM accepts Visa, MasterCard and American Express for payment of registration fees, special functions, memberships, and book orders. When you complete the Preregistration Form, please be certain to indicate the type of credit card, the account number and the expiration date.

© TELEPHONE MESSAGES

The telephone number of the Hyatt is (713) 654-1234. The Hyatt Hotel will either connect the caller with the SIAM registration desk or leave a message in the attendees hotel room.

NON-SIAM MEMBERS

Non-member registrants are encouraged to join SIAM in order to obtain the member rate for conference registration and enjoy all the other benefits of SIAM membership. Join SIAM by sending your completed membership form (see p. 15 & 16) along with your conference registration form. Be sure to include both membership dues and registration fees in your payment for a savings of \$45.00.

SIAM CORPORATE MEMBERS

Non-member attendees who are employed by the following institutions are entitled to the SIAM member rate.

Amoco Production Company AT&T Bell Laboratories Bellcore The Boeing Company BP America Cray Research, Inc.
