### Regional Climate Informatics: A Statistical Perspective

8:15 AM-9:30 AM

Room: Capitol Ballroom DE - 3rd Floor

Chair: Zhi-Hua Zhou, Nanjing University, China

As attention shifts from broad global summaries of climate change to more specific regional impacts there is a need for the data sciences to quantify the uncertainty in regional predictions. This talk will provide an overview on regional climate experiments with an emphasis on the data science problems for interpreting these large and complex simulations. Here a flexible spatial model based on fixed rank Kriging is implemented to handle a large number of spatial locations (LatticeKrig) and also include nonstationary spatial dependence.

### Mining Clinical Data to Build Predictive Models

1:30 PM-2:45 PM

Room: Capitol Ballroom DE - 3rd Floor

Chair: Jennifer Dy, Northeastern University, USA

The IOM's envisioned "learning health care system," uses data from each patient to teach about prevention, diagnosis, prognosis, and treatment. Several trends will enable the realization of this goal: (1) universal electronic health records, (2) recording of clinically important details to support "meaningful use" for quality of care, (3) wearable sensors that provide real-time data on every individual, (4) the "\$1000 genome" to study relations between clinical and genomic factors, and (5) "big data" techniques for analysis. With enough data, even simple machine learning techniques find strong predictive relationships. I describe our experiences predicting mortality and other important clinical risks and therapeutic opportunities for intensive care patients. Our current efforts abstract more informative features from both coded (tabular) data and narrative descriptions of the patient, biasing those unsupervised processes toward representing existing medical knowledge. I will outline what seem like further promising approaches. (Joint work with R. Joshi, A. Rumshisky, C. Hug, K. Kshetri, M. Ghassemi and T. Naumann.)

### Modeling Individual-Level Data in the 21st Century

8:15 AM-9:30 AM

Room: Capitol Ballroom DE - 3rd Floor

Chair: Joydeep Ghosh, University of Texas at Austin, USA

The collection and analysis of data related to human behavior has changed dramatically over the past 40 years, from the collection of small amounts of relatively static demographic data (such as a person's zipcode and education level), to much more detailed and dynamic transaction data (such as credit card and telephone records). More recently we have seen the rapid advent of individual-level "micro-data," including Web search, email, microblogs, online social media, geolocation data, and more. In this talk we will discuss some of the new research challenges and opportunities presented by such data. We will look at common themes across the variety of data sets and research projects in this general area, focusing both on what new types of data analysis techniques are likely to be needed, and what new scientific questions and applications are emerging in areas such as computational social science and public health.

10:00 AM-12:05 PM

*Room: Capitol Ballroom ABC - 3rd Floor*

*Chair: Jieping Ye, Arizona State University, USA*

This tutorial is aimed at those with little to intermediate experience with crowdsourcing and human computation, who are interested in learning more about the capabilities and limitations of crowdsourcing for: 1) collecting labeled data; and 2) integrating human computation with automation to build more effective, hybrid intelligent systems.

**IP4****Social Networks As Information Filters**

1:30 PM-2:45 PM

*Room:Capitol Ballroom DE - 3rd Floor**Chair: Zoran Obradovic, Temple University, USA*

Social networks, especially online social networks, are driven by information sharing. But just how much information sharing is influenced by social networks? A large-scale experiment measured the effect of the social network on the quantity and diversity of information being shared within Facebook. While strong ties were found to be individually more influential, collectively it is the strong ties that wield more influence and provide more diverse information exposure. Furthermore, the network not only transmits information, but also often modifies it, allowing it to evolve.

3:00 PM-5:05 PM

*Room:Capitol Ballroom ABC - 3rd Floor**Chair: Jieping Ye, Arizona State University, USA*

Matrix is a natural representation for many real world data, such as an image, a collection of documents and an adjacency graph, and matrix related technologies has been very popular in data analytics research because of its nice interpretability, effectiveness and efficiency. This tutorial will overview the recent advances in applied matrix technologies, include nonnegative matrix factorization, rank minimization, sparse learning and online/distributed learning strategies. We will also present how these technologies are applied in social and healthcare informatics.

### Tutorial Session: Outlier Detection for Temporal Data

8:30 AM-10:00 AM

Room: Capitol Ballroom ABC - 3rd Floor

Chair: Jieping Ye, Arizona State University, USA

In this tutorial, we will present an organized picture of recent research in temporal outlier detection. We will begin by motivating the importance of temporal outlier detection and briefing the challenges beyond usual outlier detection. Then, we will list down a taxonomy of proposed techniques for temporal outlier detection and cover some of the techniques in detail. We will summarize by presenting a collection of applications where temporal outlier detection techniques have been applied to discover interesting outliers.
